

thiscode Manual

Install + Core Features in 8 sections

Don't know a term? → docs/GLOSSARY.md (30+ terms explained)

Want a friendlier guide? → SETUP-BEGINNER.md (branching, gentle)

v1.0 unified first release

1. What is thiscode?

A Knowledge Manager plugin that bundles Claude Code + Discord bots + Codex calls + a 4-Tier vault search.

1.1. The one-line differentiator

It cascades the existing tools (obsidian-cli alone / /search alone / /vault-search alone) through a 4-Tier fallback. Fast tools first → if results are insufficient, escalate to more accurate tools.

2. Install — 5 steps

```
# 1. Prerequisites (node 18+, jq, git)
# 2. Plugin install
git clone https://github.com/treylom/ThisCode ~/.claude/plugins/thiscode

# 3. Tier 2 MCP (5 min, recommended)
bash ~/.claude/plugins/thiscode/scripts/install-vault-search.sh --apply

# 4. Tier 3 Obsidian CLI (optional, Obsidian users only)
bash ~/.claude/plugins/thiscode/scripts/install-obsidian-cli.sh

# 5. Tier 1 GraphRAG (optional, advanced – 25 min)
bash ~/.claude/plugins/thiscode/scripts/install-graphrag.sh --apply

# 6. Healthcheck
bash ~/.claude/plugins/thiscode/scripts/healthcheck.sh
```

For a branching, beginner-friendly guide: SETUP-BEGINNER.md

3. 4-Tier Search

Tier	Tool	Speed	Accuracy	Setup
1	GraphRAG (LLM + graph)	1500-3000ms	Very high	25 min
2	vault-search MCP (embedding)	500-1000ms	High	5 min
3	obsidian-cli (Obsidian index)	200-500ms	Medium	3 min
4	ripgrep (literal)	30-100ms	Low	0 min

The dispatcher tries Tier 1 → falls back to Tier 2 if results are insufficient → and so on.

4. Knowledge Manager (KM)

Three variants:

- `/thiscode:km` (lite, default) — personal vault
- `/thiscode:km at` (experimental) — team vault + Agent Teams
- `/thiscode:km plain` (internal) — CI / cron, headless

5. LLM model routing

After search, response generation auto-selects a model based on task complexity:

Task	Claude	Codex	Example
Simple	Haiku	gpt-5.5	“NuriFlow ARR”
Medium	Sonnet	gpt-5.5-codex	“Summarize the top 3 from the Q1 report”
Synthesis	Opus[1m]	gpt-5.5-codex-spark	“Infer the correlation between ARR and team size”

`scripts/route-model.mjs` uses a heuristic (query length + keywords). User override: `--model haiku|sonnet|opus`.

6. Meetings room / Codex Bridge / Shared memory / Hooks

- `/thiscode:meetings` — meeting-log folder + 4-file template, automatic
- `/codex` — bridge to OpenAI Codex (second opinion)
- `shared-memory` — 4-tier shared memory (T1 git / T2 machine / T3 project / T4 per-bot)
- `SessionStart` hook — auto-injects `soul.md`

7. 5-axis Benchmark

A 5-dimension measurement — `latency_ms` / `recall_precision` / `cost_tokens` / `setup_time_min` / `kg_depth`.

```
VAULT=~/your-vault bash benchmark/runners/run-all.sh
python3 benchmark/report-generator.py --print-only
```

For measurement methodology and how to interpret: `BENCHMARK.md`

8. FAQ + GLOSSARY references

Seven frequently asked questions: `SETUP-BEGINNER.md` FAQ section

Term glossary (LLM / MCP / CEL / embedding / precision / `kg_depth` / fallback / dispatcher / RAG, and more — 30+): `GLOSSARY.md`
